

Appln. No.: 10/688,095

Attorney Docket No. 10541-1865

I. Amendments to the Claims

1. (Cancelled)

2. (Cancelled)

3. (Cancelled)

4. (Cancelled)

5. (Currently Amended) The system according to claim [4] 11, wherein the control signal is based on the relationship

$$\begin{aligned} \text{ControlSignal} = & \beta_1 \times \text{TotalRideControl} \\ & + \beta_2 \times \text{HandlingControl} \\ & + \beta_3 \times \text{DiveSquatControl} \end{aligned}$$

where β_i are coefficients calculated based on the frequency of vibration and a summation of β_i is 1.

6. (Currently Amended) The system according to claim [4] 11, wherein the ride control component includes a bounce control component, a roll control component, and a pitch control component.

Appln. No.: 10/688,095

Attorney Docket No. 10541-1865

7. (Original) The system according to claim 6, wherein the ride control is based on the relationship

$$\begin{aligned} RideControl = & \alpha_1 \times BounceRideControl \\ & + \alpha_2 \times PitchRideControl \\ & + \alpha_3 \times RollRideControl \end{aligned}$$

where α_i are coefficients calculated based on the frequency of vibration and a summation of α_i is 1.

8. (Cancelled)

9. (Currently Amended) The system according to claim [8] 11, wherein the plurality of frequency ranges includes a low frequency range, a body mode frequency range, a medium frequency range, a wheel hop frequency range, and a high frequency range.

10. (Cancelled)

11. (Currently Amended) ~~The system according to claim 10, A~~
system for controlling an active suspension of a vehicle, having a bounce transmissibility, a roll transmissibility, and a pitch transmissibility, where the

Attorney Docket No. 10541-1865

bounce, pitch, and roll transmissibilities vary with respect to a frequency of vibration acting upon the vehicle, the system comprising:

a tunable device configured for adjusting stiffness and damping of the active suspension:

a controller in communication with the tunable device, the controller being configured to sense the frequencies of vibration and provide a control signal to the tunable device, wherein the control signal is based on a bounce component, a roll component, and a pitch component dependent on the bounce, pitch, and roll transmissibility at the sensed frequency, wherein the control signal includes a ride control component, a handling control component, and a dive/squat control component;

wherein the controller includes a plurality of control strategies corresponding to a plurality of frequency ranges, and the control signal is based on a control strategy of the plurality of control strategies corresponding to a frequency range of the plurality of frequency ranges that includes the frequency of vibration;

wherein the plurality of control strategies includes a passive suspension control strategy, a small stiffness and skyhook control strategy, a low damping control strategy, a high damping control strategy and stiff suspension strategy;
and

wherein the bounce control component is based on the relationship
